And the triter on January 30 and 31. To be apposited with the memor norm prepared by him on the same subject.

or hashish), has been known as TD (Truth Brug). It is prepared by chemists only, and is an oil which has no taste, odor or color. The preparation is a very involved process known to only down persons. The no reason to believe that any other nation or group is femiliar with the preparation and uses of the drug. This also almost impossible to analyze, and for this reason there is little danger to the finding of the liquid the arent might well say he would like to know himself so that he might be able to have been deep up thereby him doctor's prescription.

At present the oil is put up by the \_\_\_\_\_\_ in ampules of 3cc. Insomuch as a maximum dose is .03cc the ampules are too large for our use. It will be surgested to the \_\_\_\_\_\_\_ that for our use the ampules be of .5cc capacity, or even .25cc. The ampules have be passed off as insulin, name form of allergy anti-body, or the agent may feigh ignorance and say he believes they are for a vitamin deficiency. The searchers may assume of course, that the agent is a drug widlet.

Then exposed to air the oil begins to deteriorate and turns yellow-orange slowly.

However it will rem in effective for some weeks and in the ease in a cigarette it was affective to some extent after 6 months. An ampule can be recorded with a piece of rubber bewever this will in the let deterioration.

transport the himse body however should be of only .25cc expension of the usual size. The hyperbody however should be of only .25cc expension in a graduated by .25cc expension of the branch of the b

thought to all possibilities and feels certain the use of the drug is necessary. It must not be used indizeximanently indiscriminately and without the proper proceedings build-up. Its effects are to some extent similar to liquor and the subject who is suspicious and strong minded may not reveal the information of the one purpose of getting information. From him before the administration the Agent must establish some feeling of mutuality. The subject should be made to feel secure and relaxed. If possible no reference to the business of actual interest should be made until the drug has been applied and taken effect. For the foregoing reasons it may be much that the best preximance preliminary move is to get the Subject to take a few drinks of liquor.

As exemples of the foregoing, the story was teld of a vicit to a Prisoner of War Camp in Virginia where only top-notch combined German military Marie of the land sometimed were kept for interregations. One German submarine commander, who was considered outstanding in his "ield, had been the sale survivor of his submarine's sinking and it was thought he had valuable information concerning: (1) the depth to which the submarines could go with satety, and (2) the morale of German submarine crows. Both of these items were of extreme interest to Many at the time. Many attempts had been made to obtain this information from the commander the was extremely wary. At the time of the fielt, the commander was invited over to the officers' club for a few social drinks, which was more or less customary. After a few drinks and some conversation, it could be seen that while he would talk freely on almost all matters, he was well aware of the fact that an attempt might be made to obtain information from him. The conortunity was found to give him a cigarette which had been loaded and after approximately half an hour had passed from the first administration, one of the company, in a round-about and innocont manner, lead up to the question of maximum, depth. The commander, although at this time definitely under the effects of the drug, was still wary and indicated he would not give information on this point. Gome time later after two more digarettes had been consumed, the talk was lead around to morele and he freely conversed about the general lowering of German 1001-610 1645 Townser, no summer was ever obtained concerning submarine personnel, merals. maximum depth.

Another case of that of a well-inera dope peddler and racheteer in New Yrok City who was well-known to the operator from his days of law enforcement work. The dope peddler was telephoned and asked to come to see the operator who, described himself as being connected with secret government work and who was in

War. Despite the character of the peddler, he evidently harbords some feelings of patriotism and presented himself, when it was explained that it was thought his connections in Sicily could be used for espionage purposes. Conversation along this line was carried on for some time and no reference was made to any illegal activities of the dope peddler. Although the dope peddler did not drink liquor, he was persuaded to take just one liqueur to keep the operator "company." Also, during the time, three eigerettes had been given to him at different times. The effect was quite rapid and in about 30 minutes after the third ciagratte, the peddler teld freely of the many illegal activities in which he had been and was then encaged concerning the supplied of narcobies. We also named many of his associates and officials who were also involved in this activity, although he was well aware that the gerson to whom he was talking was, and might be in the future, connected with law enforcement activity.

A little later the poddler complained of feeling very light-headed, as though he had had to much liquor. He discarded this as an explanation; however, because he had had only one drink. He did state that he had been having a little trouble with his digestion and he had not eaten for approximately 24 hours. The operator to cover up this situation convinced him that the one liqueur on an empty stomach and his masting had made him sick and susceptible to the alcoholic funes. He accepted this explanation.

Another case was one which illustrated the rule that a common basis must first be established and that suspicion must be alloyed. This case involved the questioning of approximately 30 army officers in the space of one day. All of the offficers were suspected of being Communists and the interview here being held to try to establish the suspicion. It should be noted that because of the

speed with which the interrestions were carried out, no mutuality of feeling could be first established, and also because most of the men were in fact Communists and were suspicious, their fears concerning the questioning were not quieted. Revertheless, the drug was administered in digarettes and five of the thirty, even under the adverse conditions, gave full information concerning their Communist affiliations.

## Administration

Administration of the drug in cigarattes is the easiest method. However, it is difficult to gaure the encount of drug taken by the subject because of the different habits of smoking of various persons. Some people smoke a eigeratte down to a small stub without withdrawing it from their mouths very often, whereas others take only a few puffs and in the iterim either hold the eigeratte in their hunds or place it on an ash tray. To load a eigeratte, the models chould be thrust in the center along the existent of the encountering and the from the constitution of the drug to be form the from the constitution of the drug to be from the from the constitution of the drug to be form the support of the support of the support of the support of the constitution of the deposit the drug one insher without the constitution of the constitution of the constitution of the deposit the drug one insher without the constitution of the constitution of the deposit the drug too near the paper and stain it. The operator must be careful not to deposit the drug reach the paper and stain it. The operator may choose to place either .03 co in one circurtoe or .01 co in each of three eigenrattes to ret careful desagns.

diserves, and the like. Here it is assumed that all of the dose will be consumed and there is the further advantage that some threat may be true of the amount consumed. For instance, .01 cc could be placed in each of three chocolates which could be given the subject at different times, so as to stretch out the operation.

This may be valuable on occasions because it may be that the required effect will be obtained from .01 cc and that the person might be everence with .03 cc and thereby frustrating the attempt. The hypodermic may be carried wrapped up in a pocket to a place where food will be served and the subject will be presently or effective it may be used in the hors. Preparation of the particular places to be used may be made well in advance.

The administration of the drug in liquor is the most satisfactory, inasmuch as the subject in rationalizing his physical feeling will ascribe his feeling of light-headedness to the liquor. The difficulty is, however, that the oil is not solubble in liquor and in feet is only sparingly soluble in straight grain sleebel.

Then proper are placed in liquor it will be found that they will remain as small droplets and will settle to the bottom of the container. In attempt is being the made to develop a tircture which can be used directly in liquor or them depends.

specimentally 15 minutes. In a food assimilation the effect may appear ony—

These are are always depended in the law tools, therefore, where from 15 to 45 minutes. He tire of reaction will differ with each person; and depends upon the physical condition of the subject, the amount of food or liquor he has confirmed, the length of time since his last meal, etc. In contral, it may be said that his bire of reaction will been the come pations the time of reaction to alcoholic stimulants under the same conditions.

The contral, and a function of the same conditions.

The operator must not become impatient because of the danger of giving too much interest to the subject. Thile the drug will not cause hamful effects or injure the subject, it will cause him to lose consciousness in the cause manuer as one who is completely drunt, and no further questioning who attempted. It is because of this factor that it is advisable to administer the drug in doses of old or over a period of time which will permit observation of accounts.

The oil is extremely miscome and for this reason much be ajected slowly from the hypodermic. If it is attempted to force the liquid out rapidly, the recult may be to force the needle and force the hypodermic into the article in which the oil is being injected. Pecause of this characteristic of the oil. the hypodermic cannot be filled by display the needle into the liquid. The needle must be taken off the hypodermic and the liquid drawn in through a large aperture in the hypodermic body. The liquid exhibits less viscosity at higher temperatures.

It has been found that the amount of drink or food sensured by the subject during the time the drift is administered has no effect on the results produced by the drug as such. It may be that the subject becomes nauscated, however, this will only result from too much food or drink and not from the drug.

Che administration of from .01 co to .03 co will as a rule last in effect from one-half to one hour. It may take as much as two two three hours in extreme cases to administer the drug end reduce the subject to a point where he talks freely. Posauce of this, it is essential that no operation of this kind be carried there it is there will be no interruptions for a period of three or four hours. This the subject is under the influence, he will exhibit all the evidence of being very drunk and for this reason his appearance in public may excite considerable suscicion and comment:

TOROGER

by alsohel. The brain appears to be interiorated, because, no defusions are produced duced such as occur in the use of some other drues. The frue appears to all inhibitions and to the areas of the brain which position an indicate interior the areas of the brain which position an indicate interior the areas of the brain which position are indicated to be brain to be a second to b

liquer. Texual inhibitions are the sense of humor is accentuated to the point where almost any statement can seen ridiculously funny, and, on the other hand, where a person is basically man, he may not even meaner. In some cases, repressions are emphasized; however, this does not appear to affect the civing of information or answering questions. In some case of the found that while repressions are emphasized for a time, this condition will gradually clear up. It was stated that, generally specking, the reaction will be one of extreme pleasure, producing an hilarious mood and the communications. The tendency to include in practical jokes of a simple nature and horseplay.

l'iscellancous

Tests have shown that the drug may remain noticed in a circrette for a couple of weeks and in one case it was found that considerable reaction was sousced by a circrette in which the drug had been introduced approximately six wenths before. As a percent rule, the drug would keep over letter in feed unless the food itself were to spoil.

Passession of the drug is contrary to Veder'al law, and a special license, obtaining to from the Europe of Marcotics, is necessary to local its necessary. This fact may be used to provent the patientian of this drug by nersons not in the employ of the Covernment and who chould have no access to the drug.

Then the effects of the drug wear off, the subject will, as a sule, have no sense of nauces or feel other physical effects, or he might in the case of interiorisin caused by liquor. We will be confectly aware of the fact that he talked freely and the proposation of the fact that memory will be in no way affected, and as a sule subject will ascribe his looseness of tempos to the fact that he was interiorated. It should be remembered

that in some cases where an individual has reconled extremely confidential information, his memory of the fact when he recains normality may cause him to take desperate action of one sort or another, such as leaving the country, attempting to do the operator harm, or to commit suicide. Decause of these possibilities this fact must be given consideration before, the drug is administered.
